8	ABSTRACT OF THE DISCLOSURE
9	A multi-service segmentation and reassembly (MS-SAR) integrated circuit is
10	disposed on a line card in a router or switch. The MS-SAR can operate in an
11	ingress mode so that it receives packet and/or cell format data and forwards that
12	data to either a packet-based or a cell-based switch fabric. The MS-SAR can also
13	operate in an egress mode so that it receives data from either a packet-based or a
14	cell-based switch fabric and outputs that data in packet and/or cell format. The MS-
15	SAR has a data path through which many flows of different traffic types are
16	processed simultaneously. Each flow is processed by functional blocks along the
17	data path in accordance with one of several application types, the application type
18	for a flow being predetermined by the host processor of the router or switch.

Segmentation, reassembly and partitioning techniques are disclosed that reduce

costs and facilitate high-speed operation.
